November 7, 2024

1 Project 4: Music Popularity Prediction

By: Robert S Balch

1.1 Hypothesis:

The popularity of a song on Spotify's Top 200 Weekly (Global) charts in 2020 & 2021 is likely influenced by a combination of audio features, artist popularity, and chart performance metrics. Specifically:

1. Audio Features:

- Loudness and Energy are likely to be strong predictors of popularity, as more energetic and louder songs tend to perform better on charts.
- Danceability and Valence (positiveness) may also be important, as upbeat and positive songs often appeal to a wider audience.
- Tempo could be a factor, with faster-paced songs potentially being more popular in certain genres.

2. Artist Popularity:

• The number of artist followers is likely to be a significant predictor, as more popular artists tend to have more popular songs.

3. Chart Performance Metrics:

• Highest Charting Position and Number of Times Charted are likely to be strong indicators of overall popularity.

4. Genre:

• Certain genres (e.g., pop, hip-hop) may be more represented in the top charts, potentially influencing popularity.

5. Song Characteristics:

• Duration might play a role, with shorter songs potentially being more popular in recent years.

6. Release Timing:

• The release date of the song could influence its popularity, with songs released earlier in the year potentially having more time to accumulate popularity.

7. Feature Interactions:

• The interaction between audio features and artist popularity could be important. For example, a highly energetic song by a popular artist might be more likely to be popular than a similar song by a less known artist.

8. Cultural and Temporal Factors:

 \bullet The dataset spans 2020 & 2021, which includes the COVID-19 pandemic period. This might have influenced listening habits and song popularity.

```

8 Spotify Song Popularity Prediction Modeling Results

The modeling results from the Spotify song popularity prediction project, using tree-based regression models, offer several insights. Both standard scaling and min-max scaling methods were applied to the data before training the models.

8.1 Initial Model Performance

- Linear Regression: Both scaling methods produced similar RMSE scores (around 15-18%) and low R2 scores (around 0.02 or lower), suggesting that linear regression may not be the best fit for this data.
- Decision Tree: The decision tree model consistently performed poorly with high RMSE scores (around 21-23%) and very low, negative R2 scores (around -0.78 or lower), suggesting over-fitting and a poor ability to generalize to unseen data.
- Random Forest: Random Forest performed slightly better than Linear Regression with a slightly lower RMSE score but a lower R2 score.
- XGBoost: The XGBoost model had RMSE scores around 17-20% and R2 scores of -0.2 or lower.

8.2 Initial Feature Importance

- Across all models and scaling methods, "Loudness" consistently emerged as the most important feature for predicting song popularity.
- Other important features included "Liveness," "Tempo," "Duration (ms)," "Speechiness," "Acousticness," "Energy," and "Valence," with their relative importance varying slightly between models and scaling techniques.

8.3 Improved Model Performance

After incorporating additional features and refining the approach, the model performance significantly improved:

- The Random Forest model emerged as the most effective, achieving an RMSE of 9.39% and an R2 score of 0.65 using standard scaling.
- These results are substantially better than the previous iterations, indicating a marked improvement in model performance.

8.4 Revised Feature Importance

- "Artist Followers" became the most dominant predictor of song popularity across all models.
- "Highest Charting Position" and "Number of Times Charted" also emerged as highly important features
- The audio features, while still relevant, became less dominant in the feature importance rankings.

8.5 Key Takeaways

- 1. The inclusion of artist-related features and past chart performance significantly enhanced the model's ability to predict song popularity.
- 2. The dominance of "Artist Followers" suggests that an artist's existing fanbase is a crucial factor in a song's popularity.
- 3. The importance of "Highest Charting Position" and "Number of Times Charted" indicates that past chart performance is a strong predictor of future success.
- 4. The continued relevance of audio features suggests that the song's characteristics still play a role, albeit a less dominant one.

5. The improved performance across models indicates that th### STD Model Table results = 'Model': ('Linear Regression', 'Decision Tree', Comparison 'Random Forest', 'XGBoost'], 'RMSE': [np.sqrt(mean squared error(y test 1, y pred lr)), np.sqrt(mean_squared_error(y_test_1, $y_pred_dt)$, np.sqrt(mean squared error(y test 1, y pred rf)), np.sqrt(mean squared error(y test 1, y pred xgb))], 'R2 Score': [r2_score(y_test_1, y_pred_lr), r2_score(y_test_1, y pred dt), r2 score(y test 1, y pred rf), r2 score(y test 1, y pred xgb)] }

results_df = pd.DataFrame(results) print(results_df)

- These results suggest that a song's popularity is heavily influenced by factors external to the song itself, such as the artist's popularity and past chart performance.
- This could have implications for how new artists or songs with less chart history are evaluated and promoted.

8.6 Potential for Further Improvement

• While the results are good, there might still be room for improvement through techniques like hyperparameter tuning or exploring other models.

8.7 Limitations

- The strong performance of the model might be partly due to the inclusion of features that are highly correlated with the target variable (popularity).
- This could potentially lead to overfitting or reduced generalization to completely new songs or artists.

In conclusion, the iterative refinement of the model has yielded significantly improved results. The inclusion of additional features has provided valuable insights into the factors driving song popularity on Spotify. The dominance of artist-related and chart performance features suggests that these factors play a crucial role in determining a song's success, potentially more so than the song's audio characteristics alone.
